

Name: _____ Date: _____

Period: _____

Exit Ticket — Answer independently

1. Identify the amplitude, period, phase shift, and midline of the function

$$f(\theta) = -3\sin\left(2\left(\theta + \frac{\pi}{4}\right)\right) - 1$$

Amplitude: _____

Period: _____

Phase shift: _____

Midline: _____

2. Circle the letter of the equation that matches this description:

“A sinusoidal function with amplitude 4, period π , no phase shift, and midline $y = 2$.”

(A) $y = 4\sin(\pi\theta) + 2$

(B) $y = 4\sin(2\theta) + 2$

(C) $y = 2\sin(4\theta) + \pi$

(D) $y = 4\sin(\theta) + 2$

3. In one sentence, explain the difference between the *period* and the *amplitude* of a sinusoidal function.
